

Simichrome Polish

The world's finest all-metal polish

S*imichrome* brings without scratching a brilliant shine to any uncoated, non-ferrous metal surface – brass, gold, silver, aluminium, magnesium, pewter, chrome, sterling, copper, stainless steel, even plexiglas.

S*imichrome* is a polishing paste which produces a beautiful high finish with very little effort. Simply rub on with a soft cloth and rub off to obtain a brilliant luster. It makes chain polishing very easy.

S*imichrome* removes tarnish, dirt and oils, and generally renews polished metal surfaces. It leaves a protective film which retards oxidation.

S*imichrome* is also great for testing the authenticity of Bakelite. A small amount of this paste is rubbed on the surface of the Bakelite with a cotton swab. If the polish turns yellow, the piece is Bakelite, if it remains pink, the piece is not Bakelite.

S*imichrome* works great on antiques, jewellery, guns & knives, motorcycles, automotive cleaning, and other general home use. It is the perfect product to polish tool and die molds, extrusion dies... anywhere an ultra fine finalpolishing is required.

S*imichrome* is a unique, non-toxic and non-corrosive compound and the abrasive partical size is 8 to 10 microns. Their shelf life is about five years stored cool and dry.

S*imichrome* is available in a convenient 50 gram tube (24 tubes in a box) and in cans of 250 and 1000 gram.
